

# Medical Diagnosis Workflow Flowchart

The medical diagnosis process is a systematic approach to identifying diseases and determining the appropriate treatment plan. This workflow ensures that healthcare professionals follow a logical progression from symptom assessment to diagnosis confirmation.

## Step-by-Step Process:

### - Patient Describes Symptoms

The patient provides a detailed account of their symptoms and medical history.

### - Conduct Medical Examination

A physician performs a physical assessment to check for visible signs of illness.

### - Order Diagnostic Tests

If necessary, lab tests, imaging scans, or specialized diagnostic procedures are requested.

### - Review Test Results

The physician evaluates the diagnostic reports to identify possible conditions.

### - Confirm Diagnosis

A final diagnosis is determined based on symptoms, examination findings, and test results.

### - Recommend Treatment

The appropriate treatment plan, including medication, therapy, or further medical procedures, is prescribed.

### - Diagnosis Completed

The patient receives medical guidance based on the diagnosis, and further monitoring is scheduled if needed.
